BIRLA INSTITUTE OF TECHNOLOGY & SCIENCE, PILANI (RAJASTHAN)
II SEMESTER 2017-2018
ASSIGNMENT-1

Course No.:	**IS F462**	**Course Title:**	**Network Prog.**
Due Date:	**28-Feb-2018**	**Maximum Marks:**	**60 (10%)**

Note:

- Maximum two students per group.
- Upload code in http://nalanda. Name your file idno1_idno2_assignment1.tar .

P1. In this problem you will implement a command line interpreter or shell**.** The shell takes in a command from user at its prompt and executes it and then prompts for more input from user.

(a) shell should execute a command using fork()and execve() calls. It should not use temporary files, popen(), or system() calls. It should not use sh or bash shells to execute a command. Once the command is completed it should print its pid and status.

(b) shell should support <, >, and >> redirection operators.

(c) shell should support pipelining any number of commands. E.g.: ls|wc|wc, cat x| grep pat| uniq| sort

(d) shell should support two new pipeline operators "||" and "|||". E.g.: ls -l || grep ^-, grep ^d. It means that output of ls -l command is passed as input to two other commands. Similarly "|||" means, output of one command is passed as input to three other commands separated by ",".

(e) Implement any other feature not covered in (a) to (d) and available in contemporary shells.

[3+4+7+6+6=26M]

Write a program called *shell.c* that implements the above requirements.

Deliverables:

- shell.c
- pdf explaining the design features for (a) to (d) and feature selected for (e) [4M]

P2. Consider the requirement for a chat server which enables multiple users to send messages to each other. Server should use message queues for IPC. It should not use temporary files or database to store data.

(a) a user should be able to join or leave the chat system.

(b) a user should be able to get the list of users with the status (whether online or not).

(c) a user should be able to send messages to any or all either online or offline.

(d) server should create a new process for every client connection and use message queues for communicating among the children processes.

(e) Implement any other feature not covered in (a) to (d) but available in chat apps.

[3+4+7+6+6=26M]

Write a program called *chat.c* that implements the above requirements.

Deliverables:

- chat.c
- pdf explaining the design features for (a) to (d) and feature selected for (e) [4M]
